

EXECUTIVE SUMMARY

Moderne Development, Inc. (MDI)

Building the Next-Generation Platform Integrating AI-Enabled Robotic in Construction

Company Overview

MDI (Moderne Development, Inc.) is building a next-generation Operating System (MDOS) for Developers, Builders and the whole Architectural, Engineering, Construction (AEC) industry. The platform uses digital construction workflows; AI enabled Robots and Construction Tech (ConTech) integrated into proven building systems through a scalable development ecosystem. An end-to-end build stack that leverages AI to align real estate, design, and construction processes, enabling seamless, human-guided execution from concept to completion. A system where Developers and Builders Connect to Construct.

The MDOS Platform

At the core of MDI's platform is an AI driven Real Estate opportunity tool, a library of site adaptable building designs, engineering, and software systems that rapidly develop a digital twin for each project, with AEC-ready BIM files and robotic integrations. These models incorporate:

- Cost estimating and project feasibility tools
- Zoning constraints and regulatory compliance workflows
- Engineering and material specifications
- Robotic construction workflows for automation-ready deployment

Developers and Builders can leverage these BIM assets to rapidly evaluate land, generate project feasibility, and deploy automated construction technologies such as 3D concrete printing, prefabrication, and robotic assembly, allowing projects to move seamlessly from digital design to physical construction.

Strategic Market Position

Unlike traditional stakeholders in construction, such as architects, contractors, or materials suppliers, MDI operates from the developer's vantage point by joint-venturing with builders and developers early on to validate its designs, BIM assets, technology integrations, and construction processes in real-world conditions. This hands-on deployment model ensures the platform is refined through live projects rather than developed in isolation. MDI has already signed on its first pioneering builders and developers, establishing an early adopter network that is actively advancing the next generation of technology-enabled construction.

Traction & Partnerships

MDI has already begun establishing partnerships with leading construction technology manufacturers, including robotics and additive manufacturing companies, while advancing pilot development opportunities in both the United States and the United Kingdom. These initiatives demonstrate how advanced construction systems can deliver;

- Easy integration into existing building systems
- Faster build times through robotic and automated construction
- Lower labor requirements addressing industry-wide workforce shortages
- Improved cost certainty for residential and commercial development

Market Opportunity

As the global construction industry faces severe labor shortages, rising material costs, and increasing regulatory pressure for digital project documentation, MDI's platform offers a scalable solution for modernizing how buildings are designed and delivered. By licensing its platform construction system to developers and builders, MDI aims to industrialize construction and unlock a new generation of faster, more resilient, and more sustainable buildings.

One System. Many Robots. Many Designs. Many Ways to Build Smarter.

MDOS — The Operating System for the Future of Construction
